# Eating Disorders & Oral Health

Caring for teeth & gums are important when experiencing an eating disorder

## What is oral health & why does it matter?

- Oral health is the overall health of your mouth including your teeth, gums & tongue.
- Behaviours associated with an eating disorder, such as restrictive eating and/or vomiting, may affect your oral health.
- Looking after your oral health may improve your quality of life.

## Signs & symptoms of poor oral health

- Dry mouth
- Sensitive teeth
- Swollen or bleeding gums
- Tooth wear & chipped teeth
- Holes in your teeth (tooth decay)
- Sores or ulcers in & around your mouth
- Pain or swelling in & around your mouth.

## How can teeth & gum problems be prevented?

Maintain good oral hygiene:

- ✓ Brush your teeth twice a day (use a soft toothbrush & toothpaste with fluoride).
- ✓ Floss your teeth daily.

Should you vomit:

- ✓ Rinse your mouth with water & apply a little fluoride toothpaste to your teeth.
- ✓ Wait at least 1 hour before brushing - stomach acid can soften your teeth, making it easy to wear away.

## Other ways to maintain oral health

- Stay hydrated by drinking tap water – fluoride in tap water strengthens teeth.
- Reduce smoking & alcohol intake as these can cause gum disease, tooth loss & may lead to cancer in the mouth.
- Have regular dental check ups (every 6 to 12 months) to identify problems early & watch for symptoms between visits.
